SECTION

“The **section** element represents a generic document or application section.

- W3C SPECIFICATION

SECTION

“The **section** element represents a generic document or application section.

- W3C SPECIFICATION

That sounds a lot like the definition for a **div**, doesn't it?

SECTION VS. DIV

A **div** has no semantic meaning, but the **section** element does. It's used for grouping together thematically related content.

SECTION VS. DIV

“You might want to replace some of your **div** elements with **section** elements, but remember to always ask yourself, “Is all of the content related?”

- JEREMY KEITH IN “HTML5 FOR WEB DESIGNERS”

SECTION

Example usage of the `section` tag:

```
<div class="section">  
  <h2>The Gallery</h2>  
  <!-- ... -->  
</div>
```

SECTION

Example usage of the **section** tag:

```
<div class="section">  
  <h2>The Gallery</h2>  
  <!-- ... -->  
</div>
```

```
<section>  
  <h2>The Gallery</h2>  
  <!-- ... -->  
</section>
```

THE DOCUMENT OUTLINE

The **document outline** produces an outline summary of an HTML document based on how it is marked up.

THE DOCUMENT OUTLINE

The following elements have their own self-contained outline:

- ◉ Article
- ◉ Aside
- ◉ Nav
- ◉ Section

THE DOCUMENT OUTLINE

Take the following example:

```
<h1>This is the title of the page.</h1>  
<section>  
  <h2>This is the title of a sub-section.</h2>  
</section>
```

THE DOCUMENT OUTLINE

Take the following example:

```
<h1>This is the title of the page.</h1>  
<section>  
  <h2>This is the title of a sub-section.</h2>  
</section>
```

1. This is the title of the page.
1.1 This is the title of a sub-section.

Example output of an
HTML document outline.

THE DOCUMENT OUTLINE

Take the following example:

```
<h1>This is the title of the page.</h1>  
<section>  
  <h1>This is the title of a sub-section.</h1>  
</section>
```

We can use an **h1** inside of the **section** tag, and the document outline is unchanged.

THE DOCUMENT OUTLINE

Take the following example:

```
<h1>This is the title of the page.</h1>  
<section>  
  <h1>This is the title of a sub-section.</h1>  
</section>
```

1. This is the title of the page.
1.1 This is the title of a sub-section.

*we get the same outline
as before.*

FOOTER

“The **footer** element represents a footer for its nearest ancestor sectioning content or sectioning root element.

- W3C SPECIFICATION

FOOTER

Like the **header**, the **footer** element is *not* position-dependent. It should describe the content it is contained within.

ASIDE

Initially, the HTML5 spec defined the **aside** element as being “tangentially related to the content surrounding it.”

ASIDE

The **aside** now covers various contexts:

- When used **within** an **article** element, the **aside** contents should be related to that particular **article** it is contained **within**.
- When used **outside** an **article** element, the **aside** contents should be specifically related to the **site**.

ASIDE

The **aside** now covers various contexts:

- When used **within** an **article** element, the **aside** contents should be related to that particular **article** it is contained **within**.
- When used **outside** an **article** element, the **aside** contents should be specifically related to the **site**.

This closely resembles the definition of a sidebar for a site.

ASIDE

An **aside** element is appropriate when it is used to represent content that is *not* the primary focus of an article or page, but it *is* still related to the **article** or page.

ARTICLE

“ The **article** element represents a complete, or self-contained, composition in a document, page, application, or site and that is, in principle, independently distributable or reusable, e.g. in syndication.

- W3C SPECIFICATION

ARTICLE

The **article** element is another type of **section**. It is used for self-contained related content.

ARTICLE

Determining if a particular piece of content is “self-contained:”

Ask yourself if you would syndicate the content in an RSS or Atom feed.

ARTICLE

Some uses for the **article** tag:

- A blog post
- A news story
- A comment on a post
- A review

<time>2013-09-16</time>
```

We want the format “`mm/dd/yyyy`”:

```
<time>09/16/2013</time>
```

TIME

Example usage of the `time` tag:

```
<time>2013-09-16</time>
```

We use the `datetime` attribute to get our desired format:

```
<time datetime="2013-09-16">09/16/2013</time>
```

TIME

Example usage of the **time** tag:

```
<time>2013-09-16</time>
```

We use the **datetime** attribute to get our desired format:

```
<time datetime="2013-09-16">09/16/2013</time>
```

With the **datetime** attribute, the content can be anything relevant.

TIME

Without the **datetime** attribute, content must be a valid date, time, or precise datetime.
